Continuation of 3. NOTE: The claim limitation "releasing the flexible plug intravascularly at the blood vessel puncture site" requires additional search and consideration.

Continuation of 11. does NOT place the application in condition for allowance because: Applicant argues that Hannam et al. does not disclose "that spring member 62 is coupled to the hemostatic material opposite the flexible plug". Examiner respectfully disagrees. The function of the spring member 62 is to "retain the anchor member 30 in a desired position adjacent to the wall of the artery" (Column 11, Lines 16-19). The function of the anchor member 30 is "to prevent the fibrin and thrombin materials [hemostatic material] from entering the blood vessel of the patient" (Column 12, Lines 6-10). Therefore the spring member 62 is coupled to the hemostatic material opposite the flexible plug relative to the blood vessel. Applicant argues that "plunger 38 does not couple a hemostatic body to the flexible disk at all" and "is clearly not positioned within the wall of the blood vessel puncture site". Plunger pushes the anchor member 30 out of the distal outlet 34 into the blood vessel intravascularly (FIG 3-4 and Column 10, Lines 31-33) and ejects the hemostatic material into the puncture sight (FIG 10-12 and Column 13, Lines 26-31). The hemostatic body and the flexible disk would not be coupled without the plunger and the plunger is positioned within the wall of the blood vessel puncture site for both of its functions.
